

Exercise 4: Late Orders Cursor

Create a procedure that:

- a) Uses a **cursor** to find all orders where shipped_date is NULL and order_date is more than 7 days old

For each late order:

- b) Updates the order_status to 'Late'
- c) Calculates a 5% discount for the order items
- d) Returns the total number of late orders processed

```
CREATE PROCEDURE ProcessLateOrders
AS
BEGIN
    DECLARE @OrderID INT
    DECLARE @LateOrdersCount INT = 0

    DECLARE LateOrdersCursor CURSOR FOR
    SELECT order_id
    FROM sales.orders
    WHERE shipped_date IS NULL
      AND order_date <= DATEADD(DAY, -7, GETDATE())
      AND order_status <> 5

    OPEN LateOrdersCursor
    FETCH NEXT FROM LateOrdersCursor INTO @OrderID

    WHILE @@FETCH_STATUS = 0
    BEGIN
        UPDATE sales.orders
        SET order_status = 5
        WHERE order_id = @OrderID

        UPDATE sales.order_items
        SET discount = 0.05
        WHERE order_id = @OrderID

        SET @LateOrdersCount = @LateOrdersCount + 1

        FETCH NEXT FROM LateOrdersCursor INTO @OrderID
    END
    CLOSE LateOrdersCursor
    DEALLOCATE LateOrdersCursor

    SELECT @LateOrdersCount AS TotalLateOrdersProcessed
END
```

EXEC ProcessLateOrders

84 %
